

This project is hopefully very simple and easy to use. When the project is run you will be presented with 3 options to choose from. You choose options by typing in the corresponding number; you can type 'exit' to leave the program or 'back' to go back to the previous selection options. Hopefully the rest of the program is very intuitive and easy to use as there are output lines that explain exactly what your options are. The only hard to find feature is the complete task. In order to get a task removed from the backlog you must be an employee and change the status of the task, after it has been assigned to you, the status must say "Complete" spelled exactly that way for the task to be removed and for the program to ask you how long it took to complete. Everything should be accessible by either typing one of the number keys.
